

Files/Save/Save as/Delete

The “save” command saves a list of items in memory as a .cam file to the present sub-directory. It uses the default file name, or type the name of the file in the file window. Click on the file name window. Back space, or continue left clicking to clear the window. Type the name you want, press enter and left click on the “ok” button.

The “saveas” command saves the ram buffer as a user specified file name. This command allows you to duplicate the file with another name, should you want a second modified version.

The “delete” command will eliminate any file in the SuperCam sub-directory, regardless of the file extension. Select “delete” and the screen appears. Scroll to find the file and select with the pointer. It will appear in the file name window above.

Left click on the “ok” button. The command line will ask if you are certain that you want the file deleted. Respond “yes” and the file is gone.
